

CHAPTER V
CONCLUSIONS, LIMITATIONS AND SUGGESTIONS
OF THE STUDY

A. Conclusions

Core cost components in implementing a Hospital Information System are software, hardware, personnel and maintenance. Moreover, the planning of implementation should be done thoroughly to achieve an optimum benefit.

B. Limitations

The limitation of this systematic review is that we only include the publication in peer review journals, there is a probability that this study missed some useful information from conference papers, which are common in the field of Information Technology and Communication (ITC). In this paper, we also exclude clinics or private practices, inclusion is applied to a paper that clearly mentions it being conducted in the hospital.

C. Suggestions

Future research should point on the creation of general “how-to” in implementation for the hospital management.
